Take Control of your Security Data

Cut Costs | Reduce Complexity | Maximize Visibility

Realm.Security empowers security teams to regain control over data volume, quality, and cost. Our Security Data Fabric filters noise, enriches critical events, and optimizes log storage — so you can reduce SIEM and XDR costs while accelerating investigations.

Managing Security Data at Scale Is Getting Harder

Telemetry Data is Exploding
CISOs estimate log volume has surged between 300% and 500% over the past twenty-four months.

Operational Complexity
Security teams are overwhelmed by the variability, scale, and format inconsistency across dozens of tools.

Fragmented Data Formats
Inconsistent log formats and ingestion requirements slow down operations, increase costs, and make it harder for security teams to manage.

Managing Data Destinations
Cheaper storage makes it easier to retain more data for compliance and incident response, but managing integration, normalization, and accessibility across multiple destinations remains a major challenge.

We Make Managing Security Data at Scale Easier

Reduce Security Data Costs at Scale
Automatically filter non-relevant telemetry using advanced machine learning models—without sacrificing critical detection signals.

Accelerate Time-to-Value
Pre-built integrations, parsers, and normalization pipelines enable seamless deployment in days, not months.

Eliminate Vendor Lock-In
Vendor-agnostic data normalization lets you quickly switch or consolidate technologies without disruption.

Flexible Storage Strategy
Easily route security data to multiple destinations, optimizing costs while ensuring compliance and incident response readiness.
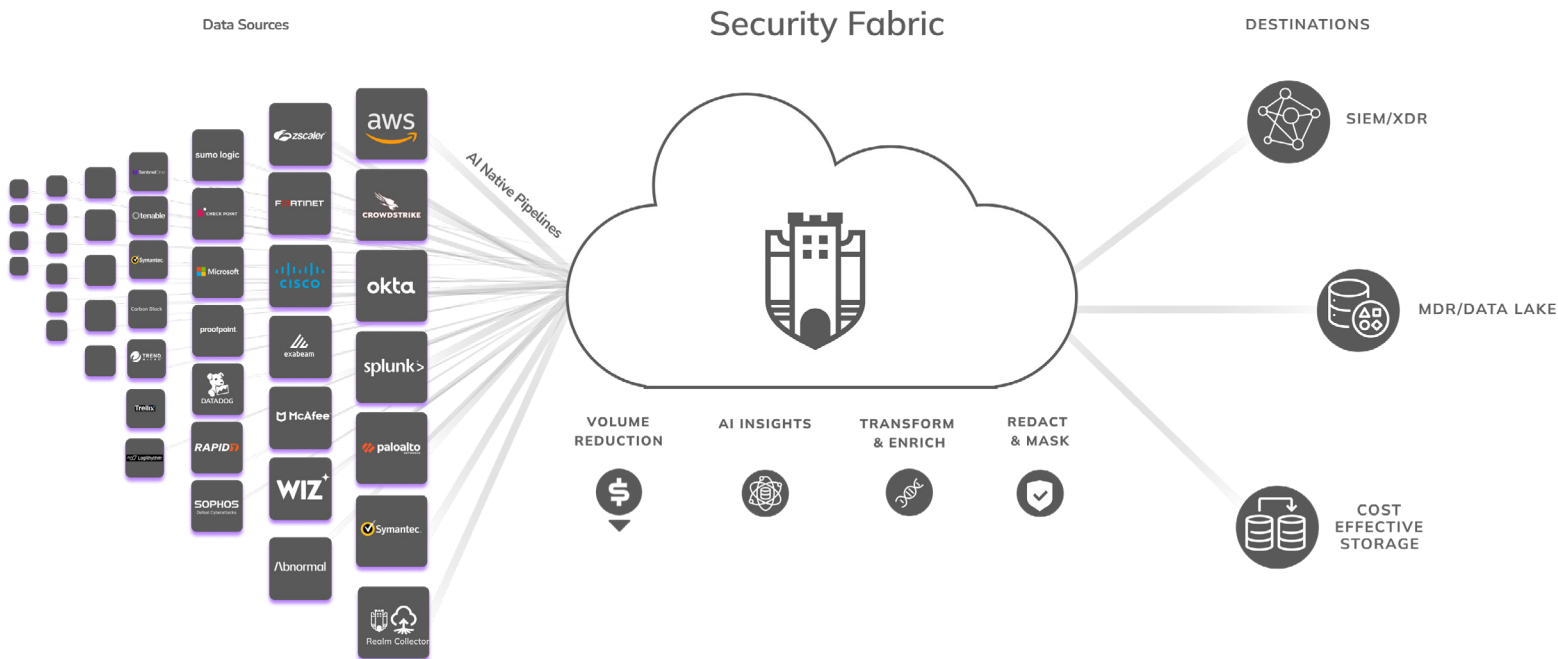

Quick to Deploy
Easy to See the Difference

Realm.Security is built for simplicity — no complex configuration, no lengthy onboarding. Most customers start seeing the following impact to their organization within the first week.

At Least 40% Reduction in SIEM Costs

Slash storage, ingestion, and processing expenses by minimizing non-relevant data at scale.

50–70% Reduction in Data Volume

Reduce the amount of security telemetry ingested into SIEM and XDR platforms without losing critical visibility.

Simplified Security Operations

Free teams from manual parser management and normalization tasks, allowing them to focus on higher-value work.
